

Example 02 — Software Tutorial Walkthrough

What this demonstrates: How a tuned prompt improves accuracy on technical terminology, CLI commands, file paths, and product names that Whisper commonly garbles (e.g. "V T T" instead of "VTT", "whisper" instead of "Whisper", misheard flag names or path separators).

INITIAL_PROMPT to Use

```
This is a software tutorial video. The presenter walks through step-by-step
instructions using technical terminology, file paths, and command-line tools.
References include Python, Whisper, FFmpeg, virtual environments, and VTT files.
Preserve exact capitalization for all product names, commands, and technical terms.
```

Recording Script

Read in a clear, measured tutorial pace — as if walking a beginner through a setup process on screen. Aim for 70 to 85 seconds.

Alright, let's walk through how to transcribe your first file using AI Transcriber.

First, make sure your virtual environment is activated. On Windows, run
`venv_win\Scripts\activate` in your terminal. On Mac, it's
`source venv_mac/bin/activate` .

Once you're in, type `python ai_transcriber.py` and hit Enter. The script will scan your current folder and list any audio or video files it finds.

If you have multiple files, you can type A to process all of them at once, or enter the number next to the file you want to start with.

On Windows, you'll see a model selection menu first. I recommend starting with Turbo — it gives you the best balance of speed and accuracy without requiring a huge amount of RAM.

The script extracts the audio track using FFmpeg, runs it through Whisper, and saves two output files: a dot-vtt file in WebVTT format for subtitle players, and a dot-txt file with timestamped text you can read directly in any editor.

Both files are saved alongside your original recording. That's it — pretty straightforward once the environment is set up.

Output Files

After transcribing, save your outputs here with these names:

File	Description
02_software_tutorial_no_prompt.vtt	Transcribed with INITIAL_PROMPT = ""
02_software_tutorial_no_prompt.txt	Transcribed with INITIAL_PROMPT = ""
02_software_tutorial_tuned.vtt	Transcribed with the prompt above
02_software_tutorial_tuned.txt	Transcribed with the prompt above

What to Look For

Compare how Whisper handles these words across the two runs:

- FFmpeg / Whisper / Python — correct product name casing?
- VTT / WebVTT — rendered as an acronym or spelled out oddly?
- venv_win / venv_mac / ai_transcriber.py — file and folder names intact?
- Turbo — recognized as a model name rather than a generic adjective?
- Path separators (\ on Windows, / on Mac) — handled correctly in context?
